Abstract

To great promotion of healthcare and medical efforts, chemistry between nursery and doctors is top priority. It is indispensable for first-line nurses to knowledgeable about different patterns of healthcare services and medical education. This article addresses this part of medical and nursery challenge.

Keywords: Healthcare; Nursing; Personalized Medicine; Underlying Diseases; Psycho-Analysis; Cancer Treatment; Pharmacology; Herbal Medicine; Viral Infection

1 Introduction

1.1 An overview

To great promotion of healthcare and medical efforts, chemistry between nursery and doctors is top priority. It is indispensable for first-line nurses to knowledgeable about different patterns of healthcare services and medical education. This editorial addresses this part of medical and nursery challenge. Several pathways and systems can provide new medical and nursery for patients' treatment promotions.

1.2 Clinical situation

Today, a half of major diseases are chronic diseases. Their treatments and recovery processes are not defined in operation-room (surgery), but getting better in the bedside—medication (drugs, nutrition, instruments and nursery) play key roles [1-11]. A great deal of chronic or dying patient in general hospitals or healthcare centers can survive longer by efforts of both doctors and nursing [11-20]. As a result, medical knowledge education is beyond limitation and across different diseases

2 Methods

2.1 Importance of high-quality medical learning for nurses

High-quality of clinical nurses can improve patient's health care a great deal by these different knowledge educations and clinical experiences [11-34]. Excellent health care services and nursery requires cooperation between doctors and nurses. (Table 1).

Table 1 A nursery service landscapes for major diseases

Disease types	Major targets
Infection	Body temperature, isolation and so on
Obstetric	Child, mother, Fetus observation
Mental disorders	Psychiatric, cognitive, depression, suicide
Neurobiology	Neurodegenerative diseases, epilepsy, depression
Cancer	Chronic body recovery and emergency
Palliative	Incurable diseases
Metabolic disease	Food and exercise assistance
Orthopedics	Immobile and osteoporosis
Cardiovascular	Blood pressure, electrocardiography and angiography
Handicaps	Limb/foot, blind, deaf and speechless
Pediatric	Helping-hands for the children
Gastro-intestinal	Bleed, digests and insomnia

2.2 Experience promotion of nursery practices (Table 2)

- Nursery recruitment (different backgrounds and gender)
- Early training (every details of hospital convention)
- Basic skill familiar (patient feeding and supports)
- Pharmacology (therapeutic outcome observation)
- Drug side-effects (check-out therapeutic toxicity and mistake)
- Assistance for doctor
- Diagnosis assistance (blood or urine tests)
- Nutrition knowledge (maintaining the health of patients)
- Communication skills
- Patient's psychiatric-index and condition (cognitive, behavior and emotions)

Table 2 Pathways for Nursery Service

Categories	Administrative
Knowledge	Broad-ranges & specificity
Communicating platforms	Regularity
Techniques	Computerization & categorization
Ethical	Clearance & mutual respects
Duty	Classification

2.3 Different types of human diseases and co-morbidity

The different patho-physiological conditions and underlying diseases will be specially treated. Nurses should notice detailed information to doctors and patient's care in different diseases.

In summary, different types of nursery play key roles in different clinical trials and circumstances, especially chronic diseases, such as suicide prevention [36-40], bone diseases [41-44], metabolic diseases [45-51], neural and mental diseases [52-54], emergence [55-58], cancer [59-64], and herbal medicine [65-70] and so on. These kinds of medical knowledge can be improved by college study and hospital practices.

3 Result and discussion

3.1 Increase clinical treatment

Nurses can be high-educated, well-experienced and responsibility. In many clinical situations, experienced nurses can be better than doctors in young age. How to use this character to enhance patient treatment in the clinic is a modern challenge.

3.2 New systems in different levels of hospitals

At present, world hospitals are divided into different categories. However, the relationship between doctors and nurses is almost no changes. In the future, if there is a possible that different medical systems can be used for different hospitals and different patients. (Table3) Thus, optimized treatment and nursery service can be provided to special patients who may be poor and suffer chronic diseases.

Table 3 Alterative Systems for Low-tier Hospitals or Healthcare Center

Systems	Major Changes by Nurses
Regular-check	Assistance for diagnostic selection
Cost-effective	Chronic diseases and prescriptions
Common-diseases	No high-risk drugs or treatments
Patients selection	Quick treatment rather than go long distances

4 Conclusion

Nursery service can be cost-effective and quick treatments. To promote these kinds of medical and healthcare services, system alterations may be useful in some low-tier hospitals and healthcare centers.
